

Vanillylmandelic acid (VMA) and homovanillic acid (HVA) are end-products of the catecholamine metabolism. The determination of VMA and HVA in urine serves as a screening test for neuroblastoma, one of the most common solid tumors in early childhood. 5-hydroxyindoleacetic acid (5-HIAA) is a metabolite of serotonin and is used for the diagnosis of carcinoid tumors (see pages 30 - 33). This ClinRep® Complete Kit from RECIPE allows a reliable determination of VMA, HVA and 5-HIAA in only 15 min time for analysis.

Also available: Complete kits for automated sample preparation (see pages 36 - 37).

→ Highly selective sample preparation
